Loading loss (lb/1000 gallons) = 12.46 * Saturation Factor * True Vapor Pressure of Liquid in psia * Vapor Molecular Weight (lb/lb-mole)/ Temperature of bulk liquid loaded, °R

Loading loss (lb/1000 gallons) = 12.46 * 0.6 * 0.0054 psia * 32.1 lb/lb-mole/ 508.22 °R = 0.00255 lb/1000 gallons

Saturation Factor is from AP-42 Section 5.2 Table 5.2-1 for submerged loading of a tank truck under dedicated normal service.

True vapor pressure is based on conservative estimate of fuel oil no. 2.

Temperature is based on average ambient temperature in Albany, NY (508.2°R based on AP-42 Section 7.1 Table 7.1-7).

1,050,000 gal / hr

Emission Factor* (lb/1000 gal)	Throughput (Mmgal)	Uncontrolled Emissions (lb/yr)
0.0021	1.05	2

* Emission Factor Calculation, from AP-42 Section 5.1, Equation 1

Loading loss (lb/1000 gallons) = 12.46 * Saturation Factor * True Vapor Pressure of Liquid in psia * Vapor Molecular Weight (lb/lb-mole)/ Temperature of bulk liquid loaded, °R

Loading loss (lb/1000 gallons) = 12.46 * 0.5 * 0.0054 psia * 32.1 lb/lb-mole/ 508.22 °R = 0.0021 lb/1000 gallons

Saturation Factor is from AP-42 Section 5.2 Table 5.2-1 for submerged loading of a barge. True vapor pressure is based on conservative estimate of fuel oil no. 2. Temperature is based on average ambient temperature in Albany, NY (508.22°R based on AP-42 Section 7.1 Table 7.1-7).

EMISSIONS FROM MARINE LOADING OF CRUDE OIL:

ALTERNATIVE OPERATING SCENARIO (CRD#1) - MARINE LOADING AT 2 MG/L WITH VAC ASSIST

Throughput: 450 Mmgal

Control Device Emission Rate: 2 mg/L equal to: 0.0167 lbs/1000 gallons

Loading into an Uncleaned Barge:

1.7975	1.05	1887	0	1887	18	18	0.01

Emission Factor Calculation from AP-42:

CL	=	Ca	+	Cg
1.7975		0.86		0.94

Cg Formula Inputs:

Vapor Pressure	12.5	(from Global data)
Molecular Weight	50	(from AP-42 Section 7.1 Table 7.1-2)
Vapor Growth Factor	1.02	(from AP-42 Section 5.2)
Temperature *R	508.5	(from AP-42 Section 7.1)

The temperature used in the Emission Factor calculation was updated for Albany, NY for latest AP-42 (June 2020).

The calculated crude emission factor is lower than the gasoline emission factor of 3.9 lb/1000 gallons.

where:

CL = Total loading loss, lb/1,000 gal of crude oil loaded.

Ca = Arrival emission factor (from Section 5.2 Table 5.2-3), contributed by vapors in the empty compartment before loading, lb/1,000 gal of crude oil loaded.

Cg = Calculated emission factor (from Section 5.2 Equation 3), contributed by evaporation during loading, lb/1,000 gal loaded.

CRUDE ALTERNATIVE SCENARIO CRD#2 ASSUMES SAME RATIOS AS GASOLINE SCENARIO TO BE CONSERVATIVE.

NOTE: Loading emission calculations were performed in accordance with guidance in AP-42, Compilation of Air Pollutant Emission Factors, Fifth Edition, Volume I. Section 5.2

** Biodiesel Only

*** Assumes worst case refined product speciation, see Loading Speciation Tab, methanol is calculated separately for biodiesel and added to refined product loading.

**** Assumes worst case of refined product and blendstock speciation, see Loading Speciation Tab

***** Assumes speciation for crude, see Loading Speciation Tab.

Refined Product loading is calculated at the allowable mg/L limit of the control device and includes the entire allowable refined product throughput at each rack. Blendstock marine loading is included as a subcap under the refined loading cap and emissions are the same as gasoline loading since it is the mg/L of the control device with no fugitives.

[1] = Biofuels only

[2] = Blendstock is based on worst case of gasoline, distillate, and blendstock. API PUBL 4723, 2002 Edition, November 2002 - Refinery Stream Speciation is used as the source for blendstock.

[3] = Source of liquid weight fraction data for Gasoline, Distillate and Crude is API 19.4. Biodiesel speciation is based on ASTM Standard D6751 requirement for methanol in biodiesel to be less than 0.2%. Liquid weight fractions are used to calculate HAP speciation for tanks based on AP-42 Chapter 7 (see individual tank pages).

[4] = Vapor Fraction is calculated based on average speciation calculated for a year in this location (see the following pages in PTE: Gasoline Monthly Speciation, Blendstock Monthly Speciation, Distillate Monthly Speciation, Crude Monthly Speciation, and Ethanol Monthly Speciation).

[5] = Refined product is based on worst case of gasoline and distillate. Biodiesel methanol emissions are calculated separately.

* These emissions are from gasoline and crude oil vapor combustion and pilot light gas. Gasoline and crude oil VOCs are already accounted for in the VCU emissions (i.e. 2 mg/l loaded or 98% efficiency).
** PM Emission Factor is from AP-42 (Table 1.4-2), as it is higher than the Emission Factor from the VCU manufacturer of zero (0). SOx Emission Factor is calculated as described below. NOx Emission Factor is from VCU manufacturer, as it is higher than the AP-42 Emission factor of 140 lbs/MMSCF (Table 1.4-1). CO Emission Factors is identical from VCU manufacturer and AP-42 (Table 1.4-1). CO2 Emission Factor is from AP-42 (Table 1.402).
** GHG Emission calculated by using the CO2 Equivalency Factor for CO2 (1), CH4 (84), and N2O (264)

Example calculation of SOx Emission Factor:

SOx Emission Factor = $y_{H2S} * (1/C) * M_{SO2} * MW_{SO2}$ (Equation from EPA Emission Inventory Improvement Program (EIIP) Document Volume 3, Ch.10: Preferred & Alternative Methods for Estimating Air Emissions from Oil and Gas Field Production & Procesing Operations, Sept. 1999, Pg 10.2-16.)

$y_{H2S, crude\ oil}$ = 0.001 (mole fraction of H2S in inlet gas (lb mole H2S/ lb mole) based on 10 ppm H2S liquid concentration)
C = 379.00 (molar volume of ideal gas at 60F and 1atm (scf/lb-mole))
M = 0.99 (molar conversion ratio from H2S to SO2 (lb-mole SO2/lb-mole H2S) (From VCU Manufacturer))
MW = 64.066 (molecular weight of SO2 (lb SO2/lb-mole SO2))

$EF_{SOX,crude\ oil}$ = 197.47 lb/ MMSCF
